                                     The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an explication an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            540

     The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS) 1 protein that specifically binds an epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial calls. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein

epitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein

The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candid

New monoclonal antibody against Candida albicans agglutinin-like sequence 1 adhesin proteins, for use as a vaccine to treat or prevent disseminated candidiasis, or to generate an immune response that blocks adherence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an an begitope in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidates and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is candida albicans agglutinin-like sequence (ALS) protein

The invention is useful as vaccines for treating and preventing disseminated candidiasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candidalbicans agglutinin-like sequence (ALS) protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a monoclonal antibody against an agglutinin-like sequence (ALS)1 protein that specifically binds an applicable in an N-terminal domain and which inhibits adherence of Candida albicans to endothelial cells. The invention is useful as vaccines for treating and preventing disseminated candidasis and for generating an immune response capable of blocking adherence of the organism. The invention is also useful in gene therapy. The present sequence is Candida albicans agglutinin-like sequence (ALS) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New monocional antibody against Candida albicans agglutinin-like sequence 1 adhesin proteins, for use as a vaccine to treat or prevent disseminated candidiasis, or to generate an immune response that blocks adherence of the organism.

The alpha-agglutinin is used in a method to immobilise enzymes to a microbial cell wall. The coding sequence is used in the production of a recombinant polyuculeotide which comprises a structural gene encoding a protein with catalytic activity and at least part of a gene encoding at least the C-terminus of a protein capable of anchoring in a eukaryotic or prokaryotic cell wall. The anchoring fragment or protein is selected from alpha agglutinin, AGA 1, FLO 1, major cell wall protein of lower eukaryotes or a proteinase of lactic acid bacteria. The recombinant polynucleotide preferably also comprises a sequence encoding a signal peptide to ensure secretion of the expressed product. The signal peptide is preferably derived from glycosyl-phosphatidyl-inositol, anchoring protein, alpha factor, alpha-agglutinin, invertase or inulinase, alpha-
                                                                                                                                                                                               379 TyrtyrthrLygLysAlaThrIleGlyAspThrAlaThrValPheIleAspValPro 398

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 22177; 122pp; English

provide for expression of a polynucleotide encoding a polypeptide from a microstream in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant croominant DNA construct and growing the transformed plant with the recombinant DNA construct and growing the transformed plant where the polynucleotide or polypeptide is useful for improving plant with the croominant DNA construct is useful for improving plant properties. CC The recombinant DNA construct is useful for producing plants with increased resistence to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic confit from usproy at sequence content. invention relates to a recombinant DNA construct comprising a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide actoring at least 8 amino acids of any of the 6808 amino acid sequences on che specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6808 amino acid sequences on conciding at least 8 amino acids of any of the 6808 amino acid sequences of ully defined in the specification. The probe is a single expressed in human cells or tissues. Also included are a spatially—adversable set of single exon nucleic acid probes for measuring human cells or its plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately or and addressably solatable or amplifiable from the plurality, a single com addressably solatable or amplifiable from the plurality, a single com and addressably solatable or amplifiable from the plurality, a single com actorarray for measuring human gene expression, a method of contiguous amino acids of any of the above-mentioned amino acid succidentally with conservative amino acid substitutionally, and contiguous amino acids of any of the above-mentioned amino acid sequences (optionally with conservative amino acids of providing contiguous amino acids of any of the above-mentionally and/or licensing single exon probes or microarrays to solated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays. Contage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes may be used as tools for surveying tissues to detect the probes of expression of a single exon probe protein of the inventions in detecting and constructing genome-color surple exon probe protein of the prome-color protein of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             800

The invention relates to human novel polynucleotides and associated colypeptides. The polynucleotides and polypeptides are useful for treating inflammatory conditions such as arthritis, mephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and brain tissue, and are useful for the treatment of central and peripheral nervous system diseases Huntington's disease and amyotrophic lateral corrections of blease. Huntington's disease and amyotrophic lateral cativity, regulation of haematopoiesis, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, cegnowth, tissue repair, healing of burns, incisions, ulcers, treatment of creenteration of bone, catilise, hone degenerative disorders and periodontal creenteration or regeneration and treatment of lung or liver fibrosis, cereorises. The sequences of the invention are also useful for gut to reperfusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SIDD), bacterial or fungal cinfections, autoimmune disorders e.g. multiple sclerosis and mysathenia cand canditions such as asthma, thrombolysis or thrombosis canditions elebaters. Abg666758 represent human

The invention relates to human novel polymucleotides and associated polymucleotides and polymeptides. The polymucleotides and polymeptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and continuous system diseases and neuropathies, such as Alabeimer's disease, nervous system diseases, Huntington's disease and amyotrophic lateral cells in ervous system disease, Huntington's disease and amyotrophic lateral cactivity, regulation of haematopoiesis, treatment of myeloid or lymphoid cull disorders and platelet disorders such as thrombocytopenia, cell disorders and platelet disorders such as thrombocytopenia, cell disorders and platelet disorders such as thrombocytopenia, cell disorders and platelet disorders such as thrombocytopenia, cereparation of bone, cartilage, tendon, ligament and/or nerve tissue crossis, osteoarthritis, bone degenerative disorders and periodontal disease. The sequences of the invention are also useful for gut creperfusion injury in various tissues, immune deficiencies and disorders inflections, aucimmune disorders e.g. multiple sclerosis and mysathenia creparation disorders. Sequences ABG6666-ABG66758 represent human congulation disorders. Sequences ABG6666-ABG66758 represent human constitutions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TCCTTAGATGGTACC------AGTGCCAATCCAGGGATACATTCACA 153

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant comprising an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the comprise or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with the complexities or polypeptides, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance to herbicides, extreme osmotic conditions, pathogens or peets, tolerance to hard disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or
                                                                                                                                                                                               Ź

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; SEQ ID NO 1353; 122pp; English.
```

```
phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.
